CAMPUS BUILD RACE · UPDATED 05 OCTOBER 2026

AI + learning notes

Three actual project examples. First-person draft for applicant review.

01 · Choose a database that can ship

Asked: Build the full PDF submission. **AI suggested:** Supabase was unavailable; use a durable fallback and portable schema. **Changed:** I selected “Use the durable fallback”. D1 now stores real registrations, counts and referrals; Supabase SQL/adapter are included. **Why:** Ship a persisted product without waiting for an unavailable account.

02 · Keep missing event details honest

Asked: Build the workshop and readiness flow. **AI suggested:** “Date to be announced”; hide calendar/group until details are verified. **Changed:** I accepted it. Links depend on event environment settings. **Why:** A polished interface must make accurate promises.

03 · Reject the first visual direction

Asked: “change the ui i need a hyper realistic ui”. **AI had produced:** A functional, flat blue-and-white UI. **Changed:** I rejected that direction. The redesign adds realistic workspace imagery, tactile Build Cards and clearer mobile hierarchy while retaining live data and three registration steps. **Why:** Better presentation with a usable flow. Browser tests caught a fixed-button layering issue; it was repaired and registration retested.

What I deliberately rejected — question 6

The first AI-built interface was functional but too flat for the presentation I wanted. I asked for a hyper-realistic redesign, kept the useful registration/referral logic, and checked the new flow at 360px. AI supplied a starting point; I still had to judge its visual quality. The fuller answer is in Question_6_Answer.pdf.

What this demonstrates

Learnability: improve with browser evidence. **Ownership:** resolve missing account access and event details. **Bias to ship:** a hosted, persisted app and exported artifacts. **Judgment:** protect private readiness and label demo data rather than treating it as acquisition.

Where I want to improve next

Run five unassisted phone tests and a two-campus pilot, measure conversion and attendance, confirm workshop details and connect an approved model. These are proposed next steps, not completed field work.

Evidence boundaries: no interviews, outreach or live model calls; campaign numbers are forecasts or labelled demo rows. The supplied video uses labelled synthetic narration. Review and personalise this draft before submission.

Sources: actual user requests and replies, implementation and browser evidence. See AI_LOG.md, Final_Audit.md and Question_6_Answer.md.
