Make the first build feel possible. Make the campus visible.

500

registrations
7 days · ₹2,000

For final-year engineering students who want a project they can explain, but are unsure where to begin.

Core promise

A free, online, one-hour workshop to build your first AI project. Choose your Build Card before sharing any details.

Three hypotheses to test

01 A named campus creates more relevant peer proof than a generic webinar.

02 A concrete first project reduces “I don’t know what to build”.

03 Readiness is a separate outcome from registration.

No student interviews were conducted. These are hypotheses from the supplied brief, not research findings or quotes. Workshop date: to be announced.

506 expected. Only six of headroom.

PROPOSED CHANNEL	EXPECTED JOINS
25 ambassadors × 130 reach × 10%	325
Referrals: 25% lift on those 325	81.25
Direct: clubs + owned communities	100
Total expectation	**506.25**

Model assumptions, not measured results. Implied mix: 64% campus / 16% referrals / 20% direct. De-duplicate reach and joins.

Break-even join rate: 9.85% (~9.9%)

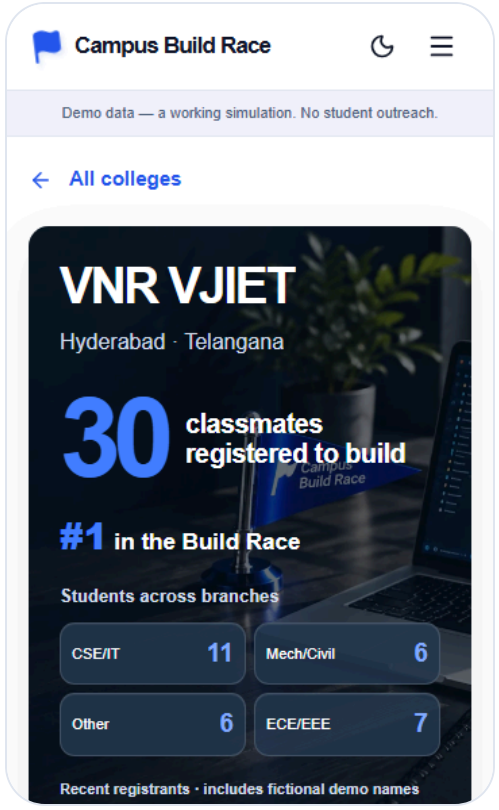

(500 − 100) ÷ (25 × 130 × 1.25). One extra active ambassador adds 16.25 expected joins.

PROPOSED SPEND	INR
Campus prizes	900
Referral rewards	500
Targeted boost	400
Reserve	200
Ceiling	**2,000**

Budget proposals require organiser approval. No prizes, rewards or certificates are promised to students.

Stress tests: 30% weaker campus join rate → 384.38 total. Only 60% of ambassadors active → 343.75 total. The plan needs an early recovery gate.

One campus link. Two taps. A first build.

01

Belong

Campus count, masked names, rank gap and last-day growth.

02

Build

Branch + interest. Build Card before the name and email form.

03

Bring

Referral code, three message angles and a private readiness list.

The growth desk connects funnel drop-offs, daily pace, ambassador referrals and a copy-only Morning Brief.

Real writes; fictional seed data.

120 labelled fictional records across 15 campuses. Counts and attribution persist in Cloudflare D1. Supabase schema and adapter included. No model key: validated template fallback.

Public workshop simulation · no outreach sent · event date and official group pending

Day 4: recover early, before the final push.

Days 1–2 · 105

Recruit 25 active reps. Give each a campus link and angle tag. Check preview taps and joins.

Days 3–4 · 240

Use referrals and Rising. If below 240, diagnose the funnel, change the pitch and recruit more active reps.

Days 5–7 · 500

Scale the measured winning angle. Use reserve only for a working channel. Nudge readiness with consent.

Daily adds: 40 / 65 / 70 / 65 / 70 / 85 / 105. The brief's 8 / 13 / 14 / 13 / 14 / 17 / 21% are daily increments; this chart corrects their cumulative interpretation. Schedule is a proposal, not an executed campaign.

Registration is the goal. Readiness earns its own measure.

Decide with the funnel

Views → starts → Build Cards → unique registrations

Referral share · joins by R / P / F angle · active ambassadors

Ready-to-build rate = all 3 checks ÷ unique registrations

Attendance is not tracked yet. Readiness is a proxy; verify actual show-up after the workshop. Demo data never counts as acquired students.

Next 24 hours

1. Run a real two-campus pilot and five unassisted phone tests; replace reach and join-rate assumptions.

2. Confirm date, group and consented reminder workflow; connect an approved model key.

3. Explore optional squad mode and an evaluator after proving the registration loop.

Risks kept visible

Inactive reps, duplicated reach, weak conversion, preview caching and low attendance. No fabricated quote, perks, urgency or personal learning history.
