What did I reject, and why?

Question 6 · Working with AI and using judgment

I rejected the visual direction of the first AI-built interface. It was functional, but its flat layout did not match the quality I wanted for the submission. I explicitly asked for a hyper-realistic redesign. The revised interface uses a realistic workspace image, stronger visual hierarchy, tactile Build Cards and a cleaner mobile registration sheet.

I kept the useful parts of the first version: a Build Card before asking for contact details, three registration steps, explicit consent and real referral tracking. The redesign was tested at 360px so that visual polish would support the main task—claiming a seat—without adding friction.

My takeaway is that AI can produce a working first version, but I still need to judge whether the result communicates the idea clearly and meets the standard I want.

Based on the actual request to redesign the initial UI. Review the first-person wording before submitting. No earlier project history or student evidence is invented.
